Our roofing systems offer a variety of styles and design options that enhance natural daylight, illuminating both new and existing spaces, while simultaneously creating striking room features

Whether a flat or elevated lantern style rooflight, for a very small outlay the introduction of our rooflights completely transform the space below into a well-lit, well-ventilated spacious architectural feature.

Rooflights can be fixed or opening, with a host of control options available.

If you are looking to refurbish an existing timber structure, our rafter bar system is the perfect solution to upgrade looks, performance, and longevity.

Flat Rooflight System

Our flat double or triple glazed rooflight system, made from sustainable materials for modern aesthetics, comes in three designs:

- Fixed
- Ventilation
- Egress

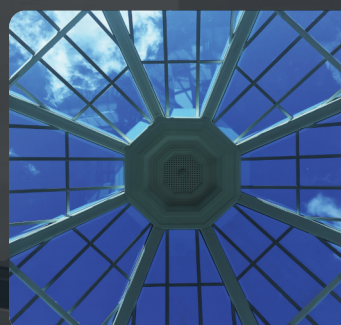

Lantern System

Our Lantern System maximizes light and volume, converting otherwise dark rooms into a light spacious environment. It features slimline glazing bars for more visible glass and a soft-line appearance with rounded corners for softer edges.

Rafter System

Designed to sit on timber structures our rafter bar system is ideal for creating a roof for a walkway or extension. The system is designed to accept either polycarbonate sheeting or glass panes ranging from 6-24mm.

Roof Glazing

The roof glazing bar range can be specified as standard or thermally improved versions. Light, standard and heavy-duty glazing bars are available. Square and sloping caps are designed to work with common infill materials from 6mm glass through to multi-wall polycarbonate sheet and insulating glass units.
